

Chapter Eighteen:

OTHER CONTROLS OR EQUIPMENT USED

Communications

M3, 4, 5 & specials Audio, Video, GSM, hard wired, wireless or wired telecoms, are all forms of communication systems that link an occupant with a visitor/user, which can be a necessary feature/requirement of a system.

If restricted access is imposed, even for a short period of time, communications between the point of access and an occupant is often needed.

The number of points of contact from the system end, back to each location requiring communications/surveillance should be considered and catered for within the system's design. Also, any likely additional points for future expansion allowed for if need be.

Command (C9) or control back from each occupant point should be designed into the system accordingly.

Extensions and satellites are often needed if side gates, exit control or additional control points, are to link into the main system.

CCTV Hard wire, microwave, or web based products and services are available to compliment installations. Background lighting, inferred or low lux options, together with black & white or colour features can be provided. Recording systems and monitors are added to complete each installation as to the specific needs of the customer.
